

Threshold rule with substructure: subhalo_model=3, factor=1e-5; truth = flat $\kappa_{\text{thr}} = 3 \times 10^{-5}$ (split halves)

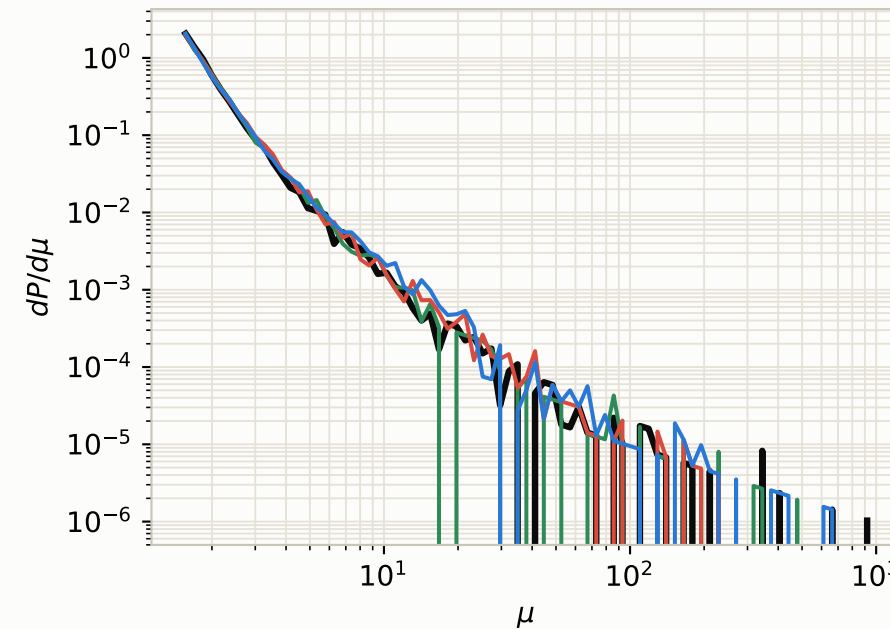

A. Distribution gap to $\kappa_{\text{thr}} = 3 \times 10^{-5}$ truth
(dash = finite-sample floor)

B. $z_s = 10$, subhalo ON: $P(\ln \mu)$

C. $z_s = 10$, subhalo ON: magnification tail

D. $z_s = 10$, subhalo ON: tail vs truth
(bars = conservative 95% CI)
