

Fixing the absolute floor removes the high- κ_{thr} collapse

- fixed fraction: $\kappa_{\text{min}} = 10^{-3} \kappa_{\text{thr}}$ (old sweep)
- fixed absolute: $\kappa_{\text{min}} = 10^{-3} \kappa_{\text{thr}}^{\text{fid}} = 1.28 \times 10^{-7}$
- predicted explicit: $\sqrt{\sigma_{\text{full}}^2 - \sigma_W^2}$ (band additivity)
- quadrature sum: $\sqrt{\sigma_{\text{explicit}}^2 + \sigma_W^2}$
- measured explicit: MC $\text{Var}(\Sigma \kappa, \kappa > \kappa_{\text{thr}})$
