

Adaptive N = 100 is the safer production rule today

Subhalo off; seed 123; 1,000,000 draws at $z_s=0.2/1$ and 300,000 at $z_s=10$. Flat thresholds fail redshift-robust PDF fidelity and do not deliver a uniform speed advantage.

A. Distribution gap

B. Science-bearing tail (95% CI)

C. Computational load driver

D. Measured production-run cost

Source: data/results/kappathr_pdf_acceptance_summary.json. Runtime is single-run wall time; explicit counts are simulator expectations.
